«Neural Network»

author Olivier Halupczok instructor dr inż. Piotr Fabian

year 021-2022

lab group even Tuesday, 10:15 – 11:45

deadline 2022-06-24

1 Project's topic

Simple Neural Network defined as a class that supports Neurons., configuring a user-defined connection structure, selected learning methid.

2 Analysis of the task

The task focuses on the analyzing data given as an input dataset and predicting the feature of the object. It requires implementation of the learning algorithm and minimizing loss of the entire neural network.

2.1 Data structures

Program has used a lot of vectors and objects of custom classes. Vectors were used to store serial data and other structures. I implemented Neuron as a class as well to make calculations easier and to order them to the proper objects.

2.2 Algorithms

The program loads input, create an instance of Neural Network Class. While calling a constructor of the Neural Network, it creates Neurons of the specified amount in the constructor parameter. When the train method is called then Network is iterating throughout the input dataset and call the loss of every iteration(epoch) and on its basis adjust the weights and biases of every Neuron.

3 External specification

This is a command line program. You can execute a program by using compiled .exe file or by using make in the e.g. Bash terminal. The program requires input datasets specified in the main.cpp

Program call

```
program
program -h
```

prints a short manual. Program called with incorrect parameters prints an error message and prints help.

After execution you can find output file in the following direction:

/logs/output.csv

You have to ensure yourself '/logs' directory exists, otherwise output file won't be created.

4 Internal specification

The program is implemented with object-oriented, structural and functional paradigm. User interface is separated from program's logic.

4.1 Program overview

The main function checks number of arguments passed to the program and creates a new Options object, which constructor check parameters of the program. If the verification is negative, an appropriate message is printed. In case of positive verification, data are read and saved into vector, which is passed, simultaneously with the options object, to the constructor of an GenerationsFactory object. Then GenerationsFactory::makeGenerations method performs genetic algorithm by creating first generation using objects of classes: Generation, Individual, and then it creates every another generation of individuals. Finally the program prints data into an output file.

4.2 Description of types and functions

Description of types and functions is moved to the appendix.

5 Testing

The program has been tested with various types of files. Incorrect files (with no numbers, numbers in incorrect format, strings with some invalid whitespaces, ...) are detected and an error message is printed. An empty input file does not cause failure – an empty output file is created. Maximal number value(**double**) in an input file is approximately 1.8e+308. Maximal input file size handled by the program is 1.57 GB. Larger files result in a bad allocation error. The program has no memory leaks.

6 Conclusions

The program implements a solution to a knapsack problem using genetic algorithm. The most challenging task is creating a crossover system where a

6 Conclusions 5

lot of data can be processed iteratively.

For some parameters the program elaborates incorrect results on some machines. This is caused by specification of the algorithm which does not includes an evolution coefficient. Algorithm also base on a small dose of randomness, and it can be successfull if generation/individuals number is insufficient.

6 Conclusions 7

Appendix Description of types and functions

knapsackProblem

Neural Network

1.1 Olivier Halupczok

1.1.1 To build and execute the whole main and compile all necesary libraries you can simply execute make command in the terminal.

TO DO:

Use custom implementation of vector inheriting from std::vector with \ast operator leading to dot product of vectors Use Model class to shape Net in a custom way Add Layer class Use passing arg by reference in dot product in mathsFUncs

2 Neural Network

Hierarchical Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Logger								 				 							 		10
CSV_Logger .																					9
NetworkResult .								 				 							 		12
NeuralNetwork .								 				 							 		14
Neuron																					15

4 Hierarchical Index

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

CSV_Logger										 											 	
Logger										 											 	. 1
NetworkResult										 											 	. 1
NeuralNetwork										 											 	. 1
Neuron																						- 1

6 Class Index

File Index

4.1 File List

Here is a list of all documented files with brief descriptions:

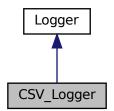

logger.cpp	
Cpp file with the definitions of the logger library	19
logger.h	
Declarations of the logger library	20
main.cpp	21
mathFuncs.cpp	
Library with math functions used in the program	22
mathFuncs.h	
Library with math functions used in the program	25
networkResult.cpp	29
networkResult.h	30
neuralNetwork.cpp	31
neuralNetwork.h	32
neuron.cpp	34
neuron.h	35

Class Documentation

5.1 CSV_Logger Class Reference

Inheritance diagram for CSV_Logger:

Collaboration diagram for CSV_Logger:

10 Class Documentation

Public Member Functions

• CSV_Logger (std::string path)

Construct a new csv logger object.

• ∼CSV_Logger ()

Destroy the csv logger objectand close opened file.

5.1.1 Constructor & Destructor Documentation

5.1.1.1 CSV_Logger()

Construct a new csv logger object.

Parameters

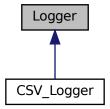

```
path to the file
```

The documentation for this class was generated from the following files:

- logger.h
- logger.cpp

5.2 Logger Class Reference

Inheritance diagram for Logger:

Public Member Functions

• Logger ()

Construct a new Logger object.

void setOutputStream (std::ostream &stream)

Set the Output Stream property.

• template<class T >

```
Logger & operator<< (T &&dataToLog)</pre>
```

Log data with << operator.

Logger & operator<< (std::ostream &(*manip)(std::ostream &))

operator with manip definition to let Logger handle io manipulators

5.2.1 Member Function Documentation

5.2.1.1 operator <<() [1/2]

operator with manip definition to let Logger handle io manipulators

Parameters

```
manip io manipulators like 'std::endl'
```

Returns

Logger& It returns instance of currently using object

5.2.1.2 operator << () [2/2]

Log data with << operator.

Template Parameters

T | template to let data of many types to be logged

Parameters

dataTal ag	Data to be printed with the leaser
uala loLog	Data to be printed with the logger

12 Class Documentation

Returns

Logger& It returns the whole instance of the object

5.2.1.3 setOutputStream()

Set the Output Stream property.

Parameters

stream	which the logs will be forwarded to
--------	-------------------------------------

The documentation for this class was generated from the following files:

- · logger.h
- logger.cpp

5.3 NetworkResult Class Reference

Public Member Functions

```
    NetworkResult (double _loss, std::vector< double > &_predictions)
    Construct a new Network Result object.
```

• double getLoss ()

Get the Loss property.

• std::vector< double > getPredictions ()

Get the Predictions property.

Friends

```
    std::ostream & operator<< (std::ostream &stream, NetworkResult &result)</li>
    print loss to the stream
```

5.3.1 Constructor & Destructor Documentation

5.3.1.1 NetworkResult()

Construct a new Network Result object.

Parameters

_loss	loss of the given epoch
_predictions	predictions of the given epoch

5.3.2 Member Function Documentation

5.3.2.1 getLoss()

```
double NetworkResult::getLoss ( )
```

Get the Loss property.

Returns

double

5.3.2.2 getPredictions()

```
std::vector< double > NetworkResult::getPredictions ( )
```

Get the Predictions property.

Returns

std::vector<double>

5.3.3 Friends And Related Function Documentation

$\textbf{5.3.3.1} \quad operator <<$

print loss to the stream

Parameters

stream	stream which the data is printed into
result	result of the given epoch
0	n

Generated by Doxygen

14 Class Documentation

Returns

std::ostream&

The documentation for this class was generated from the following files:

- · networkResult.h
- networkResult.cpp

5.4 NeuralNetwork Class Reference

Public Member Functions

NeuralNetwork (size_t numOfNeurons, std::function< double(double)> activationFunc, std::function< double(double)> activationFuncDeriv, double learningRate)

Construct a new Neural Network object.

double feedforward (std::vector< double > inputs)

feedforward every neuron from hidden layer

 void train (long long int epochs, std::vector< std::vector< double >> inputData, std::vector< double > labels, std::function< void(NetworkResult)> callback)

train neural net

5.4.1 Constructor & Destructor Documentation

5.4.1.1 NeuralNetwork()

Construct a new Neural Network object.

random number engine

Parameters

numOfNeurons	num of Neurons to create
activationFunc	function to activate neuron
activationFuncDeriv	derivative of activation function
learningRate	learning rate of the neurons

5.4.2 Member Function Documentation

5.4.2.1 feedforward()

feedforward every neuron from hidden layer

Parameters

inputs from input layer

Returns

double output of the output neuron

5.4.2.2 train()

train neural net

Parameters

epochs	determines the number of iterations through the whole dataset
inputData	dataset to train on
labels	evualuate training process
callback	callback after training

The documentation for this class was generated from the following files:

- · neuralNetwork.h
- neuralNetwork.cpp

5.5 Neuron Class Reference

Public Member Functions

Neuron (std::vector< double > weightsToInit, double biasToInit, std::function< double(double)> activation←
 FuncToInit, std::function< double(double)> activationFuncDeriv, double learningRateToInit)

16 Class Documentation

Construct a new Neuron object.

double feedforward (std::vector< double > inputsToFeed)

Feedforward with neurons from previous layers.

· double getTotal ()

Get the Total property.

• std::vector< double > getWeights ()

Get the Weights property.

• double getBias ()

Get the Bias property.

• void adjustWeight (size_t index, Neuron outputNeuron, double lossDeriv_outDeriv_calced, size_t iterator)

use backprop to adjust weight of specified index and to train network by doing so

void adjustBias (Neuron outputNeuron, double lossDeriv_outDeriv_calced, size_t iterator)

use backprop to adjust bias and to train network

double getOutput ()

Get the Output calculated during feedforward's execution.

5.5.1 Constructor & Destructor Documentation

5.5.1.1 Neuron()

```
Neuron::Neuron (
    std::vector< double > weightsToInit,
    double biasToInit,
    std::function< double(double) > activationFuncToInit,
    std::function< double(double) > activationFuncDeriv,
    double learningRateToInit = LEARNING_DEFAULT_RATE )
```

Construct a new Neuron object.

Parameters

weightsToInit	Weigths of inputs
biasToInit	Bias to calculate feedforward's total
activationFuncToInit	

5.5.2 Member Function Documentation

5.5.2.1 adjustBias()

use backprop to adjust bias and to train network

Parameters

outputNeuron	
lossDeriv_outDeriv	
iterator	

5.5.2.2 adjustWeight()

use backprop to adjust weight of specified index and to train network by doing so

Parameters

index	
outputNeuron	
lossDeriv_outDeriv	
iterator	

5.5.2.3 feedforward()

Feedforward with neurons from previous layers.

Parameters

innute	values of previous neurons
πραιδ	values of previous fleurons

Returns

double total value of neuron

5.5.2.4 getBias()

```
double Neuron::getBias ( )
```

Get the Bias property.

18 Class Documentation

Returns

double bias of the neuron

5.5.2.5 getOutput()

```
double Neuron::getOutput ( )
```

Get the Output calculated during feedforward's execution.

Returns

double - output value

5.5.2.6 getTotal()

```
double Neuron::getTotal ( )
```

Get the Total property.

Returns

double - sum of: dot product of inputs and weights, and bias

5.5.2.7 getWeights()

```
std::vector< double > Neuron::getWeights ( )
```

Get the Weights property.

Returns

```
std::vector<double> of weights
```

The documentation for this class was generated from the following files:

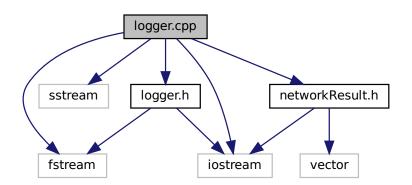

- neuron.h
- · neuron.cpp

File Documentation

6.1 logger.cpp File Reference

cpp file with the definitions of the logger library

```
#include <iostream>
#include <sstream>
#include <fstream>
#include "networkResult.h"
#include "logger.h"
Include dependency graph for logger.cpp:
```

Functions

• template Logger & Logger::operator<<< std::string > (std::string &&dataToLog)

20 File Documentation

6.1.1 Detailed Description

cpp file with the definitions of the logger library

Author

Olivier Halupczok

6.4 mathFuncs.cpp File Reference

Library with math functions used in the program.

```
#include <math.h>
#include <vector>
#include <iostream>
#include "mathFuncs.h"
```

Include dependency graph for mathFuncs.cpp:

Functions

- std::string invArgVectorsMsg (std::string nameOfFunc)
- double sigmoid (double arg)

```
return value of sigmoid function (1/(1 + exp(-arg)))
```

• double deriv_sigmoid (double arg)

return value of derivative of sigmoid

double dotProductOf2Vectors (std::vector< double > vector1, std::vector< double > vector2)

return dot product of two two components vectors

double calc_mse_loss (std::vector< double > outputTrue, std::vector< double > outputPredicted)

calculate mean squarred error of the neural network

• double lossDeriv_outDeriv (double label, double output)

it calculates value of the derivative of the Loss' function of the whole network divided by the derivative of output value's (of the entire network) function

Variables

- const std::string INV_ARG_MSG = "Invalid argument: "
- const std::string INV_VECTORS_MSG = " has to be executed with 2 vectors of the same length"
- const std::string **DOT_PRODUCT** = "dot product"
- const std::string MSE = "MSE loss calculation"

6.4.1 Detailed Description

Library with math functions used in the program.

Author

6.4.2 Function Documentation

6.4.2.1 calc_mse_loss()

calculate mean squarred error of the neural network

Parameters

outputTrue	labels of data
outputPredicted	guesses of network

Returns

double return mean squarred error

6.4.2.2 deriv_sigmoid()

```
double deriv_sigmoid ( \mbox{double $\it arg$} \ )
```

return value of derivative of sigmoid

Parameters

arg

Returns

double

6.4.2.3 dotProductOf2Vectors()

return dot product of two two components vectors

Parameters

vector1	
vector2	

Returns

double dot product

6.4.2.4 lossDeriv_outDeriv()

it calculates value of the derivative of the Loss' function of the whole network divided by the derivative of output value's (of the entire network) function

Parameters

label	labels of the learning dataset
output	output value of net

Returns

double calculated derivative

6.4.2.5 sigmoid()

```
double sigmoid ( \mbox{double $\it arg$} \ )
```

return value of sigmoid function (1/(1 + exp(-arg)))

Parameters

arg

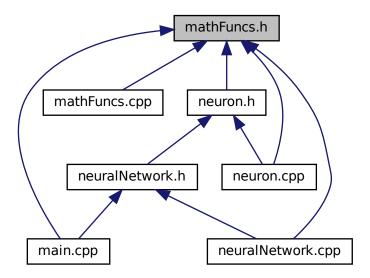

Returns

double

6.5 mathFuncs.h File Reference

library with math functions used in the program

This graph shows which files directly or indirectly include this file:

Functions

- double sigmoid (double arg)
 return value of sigmoid function (1/(1 + exp(-arg)))
- double deriv_sigmoid (double arg)
 - return value of derivative of sigmoid
- double dotProductOf2Vectors (std::vector< double > vector1, std::vector< double > vector2)
 return dot product of two two components vectors
- double calc_mse_loss (std::vector< double > outputTrue, std::vector< double > outputPredicted) calculate mean squarred error of the neural network
- double lossDeriv_outDeriv (double label, double output)

it calculates value of the derivative of the Loss' function of the whole network divided by the derivative of output value's (of the entire network) function

6.5.2 Function Documentation

6.5.2.1 calc_mse_loss()

calculate mean squarred error of the neural network

Parameters

outputTrue	labels of data
outputPredicted	guesses of network

Returns

double return mean squarred error

6.5.2.2 deriv_sigmoid()

```
double deriv_sigmoid ( \mbox{double $\it arg$} \mbox{)}
```

return value of derivative of sigmoid

Parameters

arg

Returns

double

6.5.2.3 dotProductOf2Vectors()

return dot product of two two components vectors

Parameters

vector1	
vector2	

Returns

double dot product

6.5.2.4 lossDeriv_outDeriv()

it calculates value of the derivative of the Loss' function of the whole network divided by the derivative of output value's (of the entire network) function

Parameters

label	labels of the learning dataset
output	output value of net

Returns

double calculated derivative

6.5.2.5 sigmoid()

```
double sigmoid ( \mbox{double $\it arg$} \ )
```

return value of sigmoid function (1/(1 + exp(-arg)))

Parameters

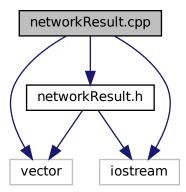

arg

Returns

double

6.6 networkResult.cpp File Reference

```
#include <vector>
